OMB No. 0704-0188

Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302, and to the Office of Management and Budget, Paperwork Reduction Project (0704-0188), Washington, DC 20503.

1. AGENCY USE ONLY (Leave blank)		2. REPORT DATE		3. REPORT TYPE AND DATES COVERED	
				FINAL 01 Sep 93 To 31 Aug 96	
4. TITLE AND SUBTITLE				5. FUNDING NUMBERS	
AASERT93 LISTENER BASED FACTORS IN PERCEPTION				F49620-93-1-0517	
				61103D	
6. AUTHOR(S)				3484/YS	
Dr Arthur G. Samuel					
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES)				AFOSR-TR-96

Dr John F. Tangney					
11. SUPPLEMENTARY NOTES					
<div style="border: 1px solid black; padding: 5px;"> <p>DISTRIBUTION STATEMENT A</p> <p>Approved for public release Distribution Unlimited</p> </div>					
12a. DISTRIBUTION/AVAILABILITY STATEMENT					
Approved for public release; distribution unlimited.					
13. ABSTRACT (Maximum 200 words)					
<p>Work was completed on Lee Wurm's dissertation. This project examined the auditory processing of prefixed English words in order to test competing models. One group of models states that morphologically complex words must be decomposed prior to lexical access, while another states that they need not be. Mixed models have also been proposed. In Experiment 1 potential stimulus items were rated along various continua by approximately 120 subjects. These ratings were used in regression analyses in two subsequent experiments. In Experiments 2-3 recognition performance data were collected using a gating paradigm and a lexical decision paradigm (38 and 110 subjects, respectively). Overall, uniqueness points and frequency measures corresponding to full-form prefixed words were much better predictors of performance than were measures corresponding to work roots. These results support a continuous processing strategy.</p>

Several experiments were completed or undertaken during the life of this grant:

Inhibition Project (Wurm, L.H., & Samuel, A.G. Lexical inhibition and attentional allocation during speech perception: Evidence from phoneme monitoring. Journal of Memory and Language [in press].) A total of 303 subjects were run in five phoneme monitoring experiments. This project was a test of the lexical inhibition prediction of the TRACE model of speech perception (McClelland & Elman, 1986). Subjects listened to a list of words and non-words and made speeded phoneme detection responses in Experiments 1 and 2. In Experiments 3-5 they had to monitor a pure tone for frequency modulations in addition to doing the phoneme detection task. We found evidence for the lexical inhibition hypothesized by TRACE, and we found that the inhibition effect interacts with attentional effects in speech perception.

Dissertation. Work was completed on Lee Wurm's dissertation. This project examined the auditory processing of prefixed English words in order to test competing models. One group of models states that morphologically complex words must be decomposed prior to lexical access, while another states that they need not be. Mixed models have also been proposed. In Experiment 1 potential stimulus items were rated along various continua by approximately 120 subjects. These ratings were used in regression analyses in two subsequent experiments. In Experiments 2-3 recognition performance data were collected using a gating paradigm and a lexical decision paradigm (38 and 110 subjects, respectively).

Overall, uniqueness points and frequency measures corresponding to full-form prefixed words were much better predictors of performance than were measures corresponding to word roots. These results support a continuous processing strategy. However, there was also evidence for a decompositional processing strategy. Strip rate interacted with judged prefixedness and semantic transparency. All three of these variables would be irrelevant to the processing system if it were operating on a strictly continuous basis. The manuscript is currently being revised for submission to a journal, and portions of the study will be presented at the 37th annual meeting of the Psychonomic Society (Chicago, October 31 - November 3, 1996).
